

**RESTORE INVESTMENT
IN AUSTRALIAN SCIENCE**

From **KILLER** to **lifesaver**

We need to back Australia's ability.

An Australian research team has discovered a molecule in spider venom that could reduce damage from heart attacks.

Breakthroughs like this don't happen by chance. They are built on years – even decades – of research and steady support.

But Australia's investment in R&D is falling behind. We're now significantly below the OECD average. Without proper funding, discoveries like this will never make it out of the lab.

We can change that.

Visit restorescience.com.au
and ask your MP to restore
investment in Australian science.
